

Win-Star Centralized Supply System

Introduction

The centralized dehumidifying drying system processes all raw materials by a standardized procedure. Subsequently, while the processed raw materials are sent to injection molding machines via closed ducts, powder created in the process are simultaneously sent to a centralized filter for further processing. As a result, pollution by hot air in the factory is greatly reduced and the air remains clean, maintaining a comfortable working environment for your valued staff and ultimately raising your productivity and reinforcing the positive image of your company.

Conveyance ducts of
the centralized Supply system

Specialized hoppers with Sight glass

Professional model

Premium model specialized
in effective powder removal.
